

Board Construction

All of our products are built from varying combinations of the layers shown below. Not every product uses all of these layers. You can see how each product differs on the right.

Thickness

In Laminate and Resilient Solutions, thickness usually indicates click strength and stability. This is generally similar with timber veneers, and thicker timber also offers better sanding potential to give the product more longevity. However, thinner timber products are less affected by water.

Timber Solutions

Protective Layer

The wear layer on our Timber Solutions consists of seven layers of UV Cured Lacquer. Although this offers less protection against wear, unlike other products, it can be sanded and recoated.

Veneer Layer (Timber)

The veneer layer on our Timber Solutions is real wood, which means every individual board is unique with unlimited features. The veneer layer also provides the option to sand the product back

Core Layer

Most of our Timber Solutions focus on a multi-layered approach where we alternate the direction of the plywood grain to maximise stability and reduce common issues such as cupping and bowing. Our Bamboo products are solid strand woven bamboo throughout.

Think of thicker timber like a luxury super car; high performance demands high maintenance.
