

Water Resistance

Water resistance is often a key consideration for our customers. Below we've outlined the two main techniques that are found in our products.

It's important to note that water resistance in flooring is never totally waterproof. If water gets under the flooring surface as the result of something like a flood, the flooring will still need to be replaced.

Surface

This synthetic flooring provides a water-resistant surface, making it suitable for moderate spills and everyday moisture, ensuring durability and ease of maintenance.

Surface & Core

Combines a water-resistant surface with a water-resistant core to provide comprehensive protection against spills, moisture, and water, ensuring both surface and core are less affected. Ideal for more areas of your home or project.

We are still one of only a few suppliers to offer this level of water resistance.

That's Clever.

Top Three Collections

1. Resilient → Vinyl
2. Resilient → Hybrid (excl. Fusion)
3. Laminate → Shield
